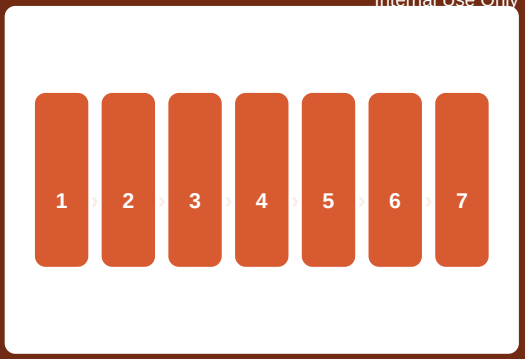
Risk Register

Identify, score, and track all operational, project, and strategic risks in a live register — ensuring every risk has an owner, a



WHEN TO USE

At the start of any project or major change. Continuously for operational risks — the register must be reviewed at least monthly and updated whenever a new risk is identified or a risk changes status.

HOW TO APPLY — STEPS

1. Identify all risks through brainstorming, lessons from past projects, and expert input
2. Score each risk: Likelihood (1–5) × Impact (1–5) = Risk Score (≥15=Critical, 10–14=High, 5–9=Medium, 1–4=Low)
3. Assign a named owner to every risk — anonymous risks are never mitigated
4. Define the mitigation action: Avoid / Reduce / Transfer / Accept — with specific steps
5. Set a review date for every risk — do not allow the register to go stale
6. Escalate Critical and High risks to leadership immediately — do not bury them
7. Close risks when they are resolved and capture lessons in the register

PRACTITIONER TIP

! A risk register nobody reads is worse than no register at all — it gives false confidence. Schedule a monthly risk review in the calendar before the risk register is even built.

KEY OUTPUTS

- Scored risk register with named owner per risk
- Risk matrix heat map (likelihood × impact)
- Risk treatment plans for Critical and High risks
- Monthly monitoring log with review history
- Escalation log for risks above the threshold

HOW TO MEASURE SUCCESS

Total risks identified; Critical/High risks with active mitigation %; Monthly review compliance rate %; Risks closed on time %; Incidents from uncontrolled risks
