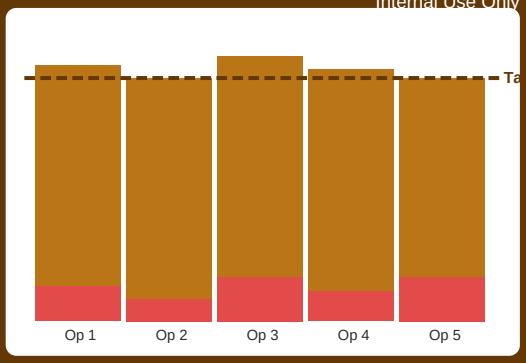
OPERATIONS

Yamazumi

A stacked bar chart visualising individual operator cycle times vs takt time — enabling balanced work redistribution to



WHEN TO USE

When designing or rebalancing a production line, service cell, or office workflow with multiple operators.

HOW TO APPLY — STEPS

1. Measure time required for every individual task each operator performs
2. Build stacked bars — one per operator — total bar height equals their cycle time
3. Draw the takt time as a horizontal reference line across all operators
4. Identify operators over takt (overloaded) and under takt (waiting)
5. Redistribute tasks collaboratively with operators to balance the line

PRACTITIONER TIP

! Rebalance WITH the operators — they know which tasks can be combined, split, or relocated in the flow.

KEY OUTPUTS

- Yamazumi stacked bar chart
- Rebalanced work assignment table
- Updated operator standard work sheets

HOW TO MEASURE SUCCESS

Line balance rate %; average operator utilisation vs takt; headcount efficiency improvement
